#### SMC3 Mouse Monoclonal Antibody [Clone ID: OTI9F3] – TA500922S

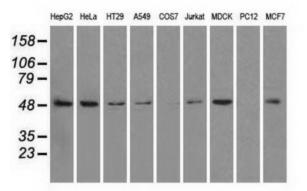

Background:The 26S proteasome is a multicatalytic proteinase complex with a highly ordered structure<br/>composed of 2 complexes, a 20S core and a 19S regulator. The 20S core is composed of 4<br/>rings of 28 non-identical subunits; 2 rings are composed of 7 alpha subunits and 2 rings are<br/>composed of 7 beta subunits. The 19S regulator is composed of a base, which contains 6<br/>ATPase subunits and 2 non-ATPase subunits, and a lid, which contains up to 10 non-ATPase<br/>subunits.Proteasomes are distributed throughout eukaryotic cells at a high concentration<br/>and cleave peptides in an ATP/ubiquitin-dependent process in a non-lysosomal pathway. An<br/>essential function of a modified proteasome, the immunoproteasome, is the processing of<br/>class I MHC peptides. This gene encodes one of the ATPase subunits, a member of the triple-A<br/>family of ATPases that have chaperone-like activity. This subunit may compete with PSMC2<br/>for binding to the HIV tat protein to regulate the interaction between the viral protein and the<br/>transcription complex. A pseudogene has been identified on chromosome 9.

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY PSMC3 (Cat# [RC201790], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-PSMC3(Cat# [TA500922]). Positive lysates [LY400992] (100ug) and [LC400992] (20ug) can be purchased separately from OriGene.

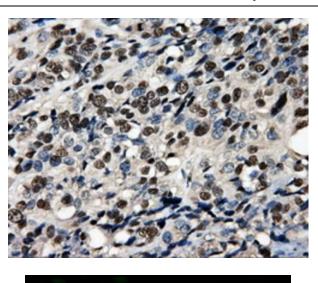

Western blot analysis of extracts (35ug) from 9 different cell lines by using anti-PSMC3 monoclonal antibody.
