| Background: | This gene encodes a protein that belongs to the serine/threonine protein kinase family. This protein contains a N-terminal protein kinase domain followed by a conserved calmodulin- binding domain with significant similarity to that of death-associated protein kinase 1 (DAPK1), a positive regulator of programmed cell death. Overexpression of this gene was shown to induce cell apoptosis. It uses multiple polyadenylation sites. [provided by RefSeq] |

Immunohistochemical staining of paraffinembedded Human prostate tissue within the normal limits using anti-DAPK2 mouse monoclonal antibody. Heat-induced epitope retrieval by EDTA solution buffer pH 8.0 at 120°C for 3 min.

Immunoprecipitation (IP) of DAPK2 by using TrueMab monoclonal anti-DAPK2 antibodies (Negative control: IP without adding anti-DAPK2 antibody.). For each experiment, 500ul of DDK tagged DAPK2 overexpression lysates (at 1:5 dilution with HEK293T lysate), 2ug of anti-DAPK2 antibody and 20ul (0.1mg) of goat anti-mouse conjugated magnetic beads were mixed and incubated overnight. After extensive wash to remove any non-specific binding, the immunoprecipitated products were analyzed with rabbit anti-DDK polyclonal antibody.
