#### Serigene UAP56 (DDX39B) Mouse Monoclonal Antibody [Clone ID: OTI2E4] – TA501235M

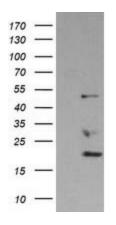

Background:This gene encodes a member of the DEAD box family of RNA-dependent ATPases that<br/>mediate ATP hydrolysis during pre-mRNA splicing. The encoded protein is an essential<br/>splicing factor required for association of U2 small nuclear ribonucleoprotein with pre-mRNA,<br/>and it also plays an important role in mRNA export from the nucleus to the cytoplasm. This<br/>gene belongs to a cluster of genes localized in the vicinity of the genes encoding tumor<br/>necrosis factor alpha and tumor necrosis factor beta. These genes are all within the human<br/>major histocompatibility complex class III region. Mutations in this gene may be associated<br/>with rheumatoid arthritis. Alternative splicing results in multiple transcript variants. Related<br/>pseudogenes have been identified on both chromosomes 6 and 11. Read-through<br/>transcription also occurs between this gene and the upstream ATP6V1G2 (ATPase, H+<br/>transporting, lysosomal 13kDa, V1 subunit G2) gene. [provided by RefSeq, Feb 2011]

#### **Product images:**

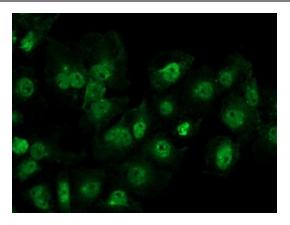

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY BAT1 ([RC201847], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-BAT1. Positive lysates [LY409144] (100ug) and [LC409144] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 9 different cell lines by using anti-BAT1 monoclonal antibody (HepG2: human; HeLa: human; SVT2: mouse; A549: human; COS7: monkey; Jurkat: human; MDCK: canine; PC12: rat; MCF7: human).
