Cytochrome c oxidase (COX), the terminal enzyme of the mitochondrial respiratory chain, catalyzes the electron transfer from reduced cytochrome c to oxygen. It is a heteromeric complex consisting of 3 catalytic subunits encoded by mitochondrial genes and multiple structural subunits encoded by nuclear genes. The mitochondrially-encoded subunits function in the electron transfer and the nuclear-encoded subunits may function in the regulation and assembly of the complex. This nuclear gene encodes polypeptide 1 (liver isoform) of subunit VIa, and polypeptide 1 is found in all non-muscle tissues. Polypeptide 2 (heart/muscle isoform) of subunit VIa is encoded by a different gene, and is present only in striated muscles. These two polypeptides share $66 \%$ amino acid sequence identity. It has been reported that there may be several pseudogenes on chromosomes 1, 6, 7q21, 7q31-32 and 12. However, only one pseudogene (COX6A1P) on chromosome 1 p31.1 has been documented. HEK293T cells were transfected with the pCMV6ENTRY control (Cat\# [PS100001], Left lane) or pCMV6-ENTRY COX6A1 (Cat\# [RC210485], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates ( 5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-COX6A1 (Cat\# TA501431). Positive lysates [LY401392] (100ug) and [LC401392] (20ug) can be purchased separately from OriGene.

Anti-COX6A1 mouse monoclonal antibody (TA501431) immunofluorescent staining of COS7 cells transiently transfected by pCMV6-ENTRY COX6A1 ([RC210485]).

COX6A1
HEK293T cells transfected with either [RC210485] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-COX6A1 antibody (TA501431), and then analyzed by flow cytometry.
