| Background: | This gene encodes a key enzyme in catabolism of quinolinate, an intermediate in the tryptophan-nicotinamide adenine dinucleotide pathway. Quinolinate acts as a most potent endogenous exitotoxin to neurons. Elevation of quinolinate levels in the brain has been linked to the pathogenesis of neurodegenerative disorders such as epilepsy, Alzheimer's disease, and Huntington's disease. [provided by RefSeq]. COMPLETENESS: complete on the 3' end. |

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY QPRT ([RC202960], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-QPRT. Positive lysates [LY402307] (100ug) and [LC402307] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 9 different cell lines by using anti-QPRT monoclonal antibody.

HEK293T cells transfected with either [RC202960] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-QPRT antibody ([TA501520]), and then analyzed by flow cytometry.
