| Background:             | The pituitary glycoprotein hormone family includes follicle-stimulating hormone, luteinizing hormone, chorionic gonadotropin, and thyroid-stimulating hormone. All of these glycoproteins consist of an identical alpha subunit and a hormone-specific beta subunit. This gene encodes the beta subunit of follicle-stimulating hormone. In conjunction with luteinizing hormone, follicle-stimulating hormone induces egg and sperm production. Alternative splicing results in two transcript variants encoding the same protein. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY FSHB ([RC214616], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-FSHB. Positive lysates [LY400397] (100ug) and [LC400397] (20ug) can be purchased separately from OriGene.

HEK293T cells transfected with either [RC214616] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-FSHB antibody ([TA501604]), and then analyzed by flow cytometry.
