Background: The protein encoded by this gene belongs to the protein kinase D (PKD) family of

serine/threonine protein kinases. This kinase can be activated by phorbol esters as well as by

gastrin via the cholecystokinin B receptor (CCKBR) in gastric cancer cells. It can bind to diacylglycerol (DAG) in the trans-Golgi network (TGN) and may regulate basolateral

membrane protein exit from TGN. Alternative splicing results in multiple transcript variants

encoding different isoforms. [provided by RefSeq]

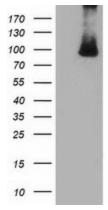

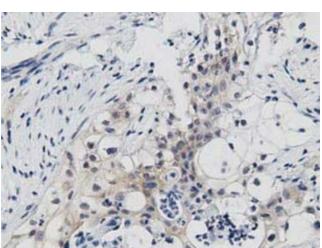

Synonyms: HSPC187; nPKC-D2; PKD2

Protein Families: Druggable Genome, Protein Kinase

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY PRKD2 ([RC215335], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-PRKD2. Positive lysates [LY402555] (100ug) and [LC402555] (20ug) can be purchased separately from OriGene.

Anti-PRKD2 mouse monoclonal antibody (TA501684) immunofluorescent staining of COS7 cells transiently transfected by pCMV6-ENTRY PRKD2 ([RC215335]).

HEK293T cells transfected with either [RC215335] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-PRKD2 antibody (TA501684), and then analyzed by flow cytometry.
