Image: CRICENEZIM2 Mouse Monoclonal Antibody [Clone ID: OTI6D12] - TA501975MBackground:In human, ZIM2 and PEG3 (GeneID:5178) are two distinct genes that share a set of 5' exons
and have a common promoter, and both genes are paternally expressed. Alternative splicing
events connect the shared exons either with the remaining 4 exons unique to ZIM2, or with
the remaining 2 exons unique to PEG3. This is in contrast to mouse and cow, where ZIM2 and
PEG3 genes do not share exons in common, and the imprinting status of ZIM2 is also not
conserved amongst mammals. Additional 5' alternatively spliced transcripts encoding the
same protein have been found for the human ZIM2 gene. [provided by RefSeq, Oct 2010]

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY ZIM2 ([RC211188], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-ZIM2. Positive lysates [LY402427] (100ug) and [LC402427] (20ug) can be purchased separately from OriGene.
