Entrez Gene 64866 Human

Q9H5V8

Background: The protein encoded by this gene is a transmembrane protein containing three extracellular

CUB domains. This protein is found to be overexpressed in colon and lung cancers. Its expression level is correlated with the metastatic ability of carcinoma cells. This protein is located on the cell surface. It has been shown to be tyrosine phosphorylated in a cancer cell line. Alternatively spliced transcript variants encoding distinct isoforms have been reported.

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CDCP1 ([RC220633], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CDCP1. Positive lysates [LY402953] (100ug) and [LC402953] (20ug) can be purchased separately from OriGene.
