| Background: | Histones play a critical role in transcriptional regulation, cell cycle progression, and developmental events. Histone acetylation/deacetylation alters chromosome structure and affects transcription factor access to DNA. The protein encoded by this gene belongs to class II of the histone deacetylase/acuc/apha family. It contains an internal duplication of two catalytic domains which appear to function independently of each other. This protein possesses histone deacetylase activity and represses transcription. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY HDAC6 ([RC209649], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-HDAC6. Positive lysates [LY401822] (100ug) and [LC401822] (20ug) can be purchased separately from OriGene.

Anti-HDAC6 mouse monoclonal antibody ([TA502222]) immunofluorescent staining of COS7 cells transiently transfected by pCMV6-ENTRY HDAC6 ([RC209649]).

HEK293T cells transfected with either [RC209649] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-HDAC6 antibody ([TA502222]), and then analyzed by flow cytometry.
