	Aquaporin 1 (AQP1) Mouse Monoclonal Antibody [Clone ID: OTI10C11] – TA502356M
Background:	Aquaporins are a family of small integral membrane proteins related to the major intrinsic protein (MIP or AQP0). This gene encodes an aquaporin which functions as a molecular water channel protein. It is a homotetramer with 6 bilayer spanning domains and N-glycosylation sites. The protein physically resembles channel proteins and is abundant in erythrocytes and renal tubes. The gene encoding this aquaporin is a possible candidate for disorders involving imbalance in ocular fluid movement. Several transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq]
Synonyms:	AQP-CHIP; CHIP28; CO
Protein Families	: Druggable Genome, Ion Channels: Other, Transmembrane

Product images:

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY AQP1 ([RC205304], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-AQP1. Positive lysates [LY403670] (100ug) and [LC403670] (20ug) can be purchased separately from OriGene.

HEK293T cells transfected with either [RC205304] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-AQP1 antibody ([TA502356]), and then analyzed by flow cytometry.
