Background:	This gene is a member of the ankyrin-repeat family and is induced by lipopolysaccharide (LPS). The C-terminal portion of the encoded product which contains the ankyrin repeats, shares high sequence similarity with the I kappa B family of proteins. The latter are known to play a role in inflammatory responses to LPS by their interaction with NF-B proteins through ankyrin-repeat domains. Studies in mouse indicate that this gene product is one of the nuclear I kappa B proteins and an activator of IL-6 production. Two transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq]

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY NFKBIZ (Cat# [RC219121], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-NFKBIZ (Cat# [TA502768]). Positive lysates [LY410530] (100ug) and [LC410530] (20ug) can be purchased separately from OriGene.

HEK293T cells transfected with either [RC219121] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-NFKBIZ antibody ([TA502768]), and then analyzed by flow cytometry.
