CRIGENE FABP2 Mouse Monoclonal Antibody (HRP conjugated) [Clone ID: OTI2C4] – TA503574BM

Background: The intracellular fatty acid-binding proteins (FABPs) belong to a multigene family with nearly twenty identified members. FABPs are divided into at least three distinct types, namely the hepatic-, intestinal- and cardiac-type. They form 14-15 kDa proteins and are thought to participate in the uptake, intracellular metabolism and/or transport of long-chain fatty acids. They may also be responsible in the modulation of cell growth and proliferation. Intestinal fatty acid-binding protein 2 gene contains four exons and is an abundant cytosolic protein in small intestine epithelial cells. This gene has a polymorphism at codon 54 that identified an alanine-encoding allele and a threonine-encoding allele. Thr-54 protein is associated with increased fat oxidation and insulin resistance. HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY FABP2 (Cat# [RC210206], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-FABP2(Cat# [TA503574]). Positive lysates [LY424906] (100ug) and [LC424906] (20ug) can be purchased separately from OriGene.

Immunohistochemical staining of paraffinembedded Human pancreas tissue within the normal limits using anti-FABP2 mouse monoclonal antibody. (Heat-induced epitope retrieval by 10mM citric buffer, pH6.0, 100°C for 10min, [TA503574])

HEK293T cells transfected with either [RC210206] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-FABP2 antibody ([TA503574]), and then analyzed by flow cytometry.
