Background:	This gene encodes a type I integral membrane protein found only in the rough endoplasmic reticulum. The encoded protein is part of an N-oligosaccharyl transferase complex that links high mannose oligosaccharides to asparagine residues found in the Asn-X-Ser/Thr consensus motif of nascent polypeptide chains. This protein forms part of the regulatory subunit of the 26S proteasome and may mediate binding of ubiquitin-like domains to this proteasome. [provided by RefSeq]

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY RPN1 ([RC201554], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-RPN1. Positive lysates [LY418997] (100ug) and [LC418997] (20ug) can be purchased separately from OriGene.

Anti-RPN1 mouse monoclonal antibody ([TA503647]) immunofluorescent staining of COS7 cells transiently transfected by pCMV6-ENTRY RPN1 ([RC201554]).

HEK293T cells transfected with either [RC201554] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-RPN1 antibody ([TA503647]), and then analyzed by flow cytometry.
