GRIGENE ERCC1 Mouse Monoclonal Antibody [Clone ID: OTI5A2] – TA504405S

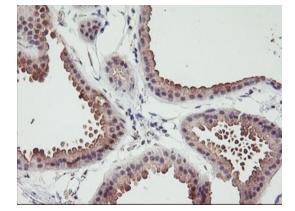

Background:The product of this gene functions in the nucleotide excision repair pathway, and is required
for the repair of DNA lesions such as those induced by UV light or formed by electrophilic
compounds including cisplatin. The encoded protein forms a heterodimer with the XPF
endonuclease (also known as ERCC4), and the heterodimeric endonuclease catalyzes the 5'
incision in the process of excising the DNA lesion. The heterodimeric endonuclease is also
involved in recombinational DNA repair and in the repair of inter-strand crosslinks.
Mutations in this gene result in cerebrooculofacioskeletal syndrome, and polymorphisms that
alter expression of this gene may play a role in carcinogenesis. Multiple transcript variants
encoding different isoforms have been found for this gene. The last exon of this gene
overlaps with the CD3e molecule, epsilon associated protein gene on the opposite strand.

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY ERCC1 ([RC200478], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-ERCC1. Positive lysates [LY419605] (100ug) and [LC419605] (20ug) can be purchased separately from OriGene.

Anti-ERCC1 mouse monoclonal antibody ([TA504405]) immunofluorescent staining of COS7 cells transiently transfected by pCMV6-ENTRY ERCC1 ([RC200478]).

HEK293T cells transfected with either [RC200478] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-ERCC1 antibody ([TA504405]), and then analyzed by flow cytometry.
