#### Science Cystatin C (CST3) Mouse Monoclonal Antibody [Clone ID: OTI2C8] – TA504442M

Background:The cystatin superfamily encompasses proteins that contain multiple cystatin-like sequences.<br/>Some of the members are active cysteine protease inhibitors, while others have lost or<br/>perhaps never acquired this inhibitory activity. There are three inhibitory families in the<br/>superfamily, including the type 1 cystatins (stefins), type 2 cystatins and the kininogens. The<br/>type 2 cystatin proteins are a class of cysteine proteinase inhibitors found in a variety of<br/>human fluids and secretions, where they appear to provide protective functions. The cystatin<br/>locus on chromosome 20 contains the majority of the type 2 cystatin genes and<br/>pseudogenes. This gene is located in the cystatin locus and encodes the most abundant<br/>extracellular inhibitor of cysteine proteases, which is found in high concentrations in<br/>biological fluids and is expressed in virtually all organs of the body. A mutation in this gene<br/>has been associated with amyloid angiopathy. Expression of this protein in vascular wall<br/>smooth muscle cells is severely reduced in both atherosclerotic and aneurysmal aortic<br/>lesions, establishing its role in vascular disease. HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY CST3 (Cat# [RC210730], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CST3 (Cat# [TA504442])(1:2000).
