#### SMA (FOLH1) Mouse Monoclonal Antibody (HRP conjugated) [Clone ID: OTI3H5] – TA504752BM

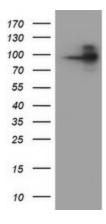

Background:This gene encodes a type II transmembrane glycoprotein belonging to the M28 peptidase<br/>family. The protein acts as a glutamate carboxypeptidase on different alternative substrates,<br/>including the nutrient folate and the neuropeptide N-acetyl-l-aspartyl-l-glutamate and is<br/>expressed in a number of tissues such as prostate, central and peripheral nervous system<br/>and kidney. A mutation in this gene may be associated with impaired intestinal absorption of<br/>dietary folates, resulting in low blood folate levels and consequent hyperhomocysteinemia.<br/>Expression of this protein in the brain may be involved in a number of pathological<br/>conditions associated with glutamate excitotoxicity. In the prostate the protein is up-<br/>regulated in cancerous cells and is used as an effective diagnostic and prognostic indicator of<br/>prostate cancer. This gene likely arose from a duplication event of a nearby chromosomal<br/>region. Alternative splicing gives rise to multiple transcript variants encoding several different<br/>isoforms. [provided by RefSeq]

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY FOLH1 (Cat# [RC218310], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-FOLH1 (Cat# [TA504752]). Positive lysates [LY429203] (100ug) and [LC429203] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 9 different cell lines by usin g anti-FOLH1 monoclonal antibody (HepG2: human; HeLa: human; SVT2: mouse; A549: human; COS7: monkey; Jurkat: human; MDCK: canine; PC12: rat; MCF7: human).
