Entrez Gene 4291 Human

P58340

Background: This gene encodes an oncoprotein which is thought to play a role in the phenotypic

determination of hemopoetic cells. Translocations between this gene and nucleophosmin have been associated with myelodysplastic syndrome and acute myeloid leukemia. Multiple transcript variants encoding different isoforms have been found for this gene. [provided by

RefSeq1

variant 2; myeloid leukemia factor 1 variant 3

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY MLF1 ([RC202774], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MLF1. Positive lysates [LY411706] (100ug) and [LC411706] (20ug) can be purchased separately from OriGene.
