Background:	This gene is one of two human genes similar to the yeast gene dph2. The yeast gene was identified by its ability to complement a diphthamide mutant strain, and thus probably functions in diphthamide biosynthesis. Diphthamide is a post-translationally modified histidine residue present in elongation factor 2 (EF2) that is the target of diphtheria toxin ADP-ribosylation. Two transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq]

Events

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY DPH2 ([RC201382], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-DPH2. Positive lysates [LY419990] (100ug) and [LC419990] (20ug) can be purchased separately from OriGene.

HEK293T cells transfected with either [RC201382] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-DPH2 antibody (TA504856), and then analyzed by flow cytometry.

Flow cytometric Analysis of Jurkat cells, using anti-DPH2 antibody (TA504856), (Red), compared to a nonspecific negative control antibody, (Blue).
