Background:	The protein encoded by this gene is a receptor for aryl hydrocarbons and a ligand-activated transcription factor. The encoded protein is found in the cytoplasm as part of a multiprotein complex, but upon binding of ligand is transported to the nucleus. This protein can regulate the expression of many xenobiotic metabolizing enzymes. Also, the encoded protein can bind specifically to and inhibit the activity of hepatitis B virus. HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY AIP (Cat# [RC211157], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-AIP (Cat# [TA505031]). Positive lysates [LY401308] (100ug) and [LC401308] (20ug) can be purchased separately from OriGene.

HEK293T cells transfected with either [RC211157] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-AIP antibody ([TA505031]), and then analyzed by flow cytometry.
