GRIGENE MRPS34 Mouse Monoclonal Antibody [Clone ID: OTI4C9] – TA505230

Background:Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in
protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes)
consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein
to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed.
Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that
the latter contain a 5S rRNA. Among different species, the proteins comprising the
mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which
prevents easy recognition by sequence homology. This gene encodes a 28S subunit protein.
Alternate splice variants of this gene have been described but their full-length nature has not
been determined. [provided by RefSeq]. COMPLETENESS: complete on the 3' end.

Synonyms:

MRP-S12; MRP-S34; MRPS12

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY MRPS34 ([RC200834], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MRPS34. Positive lysates [LY411441] (100ug) and [LC411441] (20ug) can be purchased separately from OriGene.
