	Mitochondrial ribosomal protein L11 (MRPL11) Mouse Monoclonal Antibody (Biotin conjugated) [Clone ID: OTI1E5] – TA505299AM
Background:	Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes) consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed. Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that the latter contain a 5S rRNA. Among different species, the proteins comprising the mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which prevents easy recognition by sequence homology. This gene encodes a 39S subunit protein. Sequence analysis identified three transcript variants that encode different isoforms. Pseudogenes corresponding to this gene are found on chromosomes 5q and 12q. [provided by RefSeq, Jul 2008]

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY MRPL11 (Cat# [RC200033], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MRPL11(Cat# [TA505299]). Positive lysates [LY414217] (100ug) and [LC414217] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (30ug per lane) from 8 cell lines lysates by using anti-MRPL11 monoclonal antibody ([TA505299], 1:2000).
