Serigene Her2 (ERBB2) Mouse Monoclonal Antibody [Clone ID: OTI6G9] – TA505870S

Background:	This gene encodes a member of the epidermal growth factor (EGF) receptor family of
	receptor tyrosine kinases. This protein has no ligand binding domain of its own and therefore
	cannot bind growth factors. However, it does bind tightly to other ligand-bound EGF receptor
	family members to form a heterodimer, stabilizing ligand binding and enhancing kinase-
	mediated activation of downstream signalling pathways, such as those involving mitogen-
	activated protein kinase and phosphatidylinositol-3 kinase. Allelic variations at amino acid
	positions 654 and 655 of isoform a (positions 624 and 625 of isoform b) have been reported,
	with the most common allele, Ile654/Ile655, shown here. Amplification and/or overexpression
	of this gene has been reported in numerous cancers, including breast and ovarian tumors.
	Alternative splicing results in several additional transcript variants, some encoding different
	isoforms and others that have not been fully characterized. [provided by RefSeq, Jul 2008]

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY ERBB2 ([RC212583], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-ERBB2. Positive lysates [LY417979] (100ug) and [LC417979] (20ug) can be purchased separately from OriGene.
