| Background: | Lymphocytes proliferate and differentiate in response to various concentrations of different antigens. The ability of the B cell to respond in a specific, yet sensitive manner to the various antigens is achieved with the use of low-affinity antigen receptors. This gene encodes a cell surface molecule which assembles with the antigen receptor of B lymphocytes in order to decrease the threshold for antigen receptor-dependent stimulation. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CD19 ([RC202922], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CD19. Positive lysates [LY400678] (100ug) and [LC400678] (20ug) can be purchased separately from OriGene.

Anti-CD19 mouse monoclonal antibody ([TA506280]) immunofluorescent staining of COS7 cells transiently transfected by pCMV6-ENTRY CD19 ([RC202922]).
