| Background:             | This gene encodes a protein containing two conserved tandem RNA recognition motifs.<br>Similar proteins in other species function as RNA-binding proteins and play central roles in<br>posttranscriptional gene regulation. Expression of this gene has been correlated with the<br>grade of the malignancy and proliferative activity in gliomas and melanomas. A pseudogene<br>for this gene is located on chromosome 11q13. Synonyms:

#### musashi 1; musashi homolog 1 (Drosophila)

## **Product images:**

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY MSI1 ([RC215992], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MSI1. Positive lysates [LY419331] (100ug) and [LC419331] (20ug) can be purchased separately from OriGene.

Anti-MSI1 mouse monoclonal antibody ([TA506357]) immunofluorescent staining of COS7 cells transiently transfected by pCMV6-ENTRY MSI1 ([RC215992]).
