Background:	This gene is one of the PMS2 gene family members found in clusters on chromosome 7. The product of this gene is involved in DNA mismatch repair. It forms a heterodimer with MLH1 and this complex interacts with other complexes bound to mismatched bases. Mutations in this gene are associated with hereditary nonpolyposis colorectal cancer, Turcot syndrome, and are a cause of supratentorial primitive neuroectodermal tumors. Alternatively spliced transcript variants have been observed for this gene. [provided by RefSeq, Jul 2008]

Equivalent amounts of cell lysates (10 ug per lane) of wild-type HeLa cells (WT, Cat# LC810HELA) and PMS2-Knockout HeLa cells (KO, Cat# [LC831286]) were separated by SDS-PAGE and immunoblotted with anti-PMS2 monoclonal antibody [TA506683] (1:500[°]). Then the blotted membrane was stripped and reprobed with anti-HSP90 antibody as a loading control.
