Image: MMP13 Mouse Monoclonal Antibody [Clone ID: OTI3F5] - TA506721Background:Proteins of the matrix metalloproteinase (MMP) family are involved in the breakdown of
extracellular matrix in normal physiological processes, such as embryonic development,
reproduction, and tissue remodeling, as well as in disease processes, such as arthritis and
metastasis. Most MMP's are secreted as inactive proproteins which are activated when
cleaved by extracellular proteinases. The protein encoded by this gene cleaves type II
collagen more efficiently than types I and III. It may be involved in articular cartilage turnover
and cartilage pathophysiology associated with osteoarthritis. The gene is part of a cluster of
MMP genes which localize to chromosome 11q22.3. [provided by RefSeq, Jul 2008]Synonyms:CLG3; MANDP1; MDST; MMP-13

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY MMP13 ([RC224156], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MMP13. Positive lysates [LY400869] (100ug) and [LC400869] (20ug) can be purchased separately from OriGene.
