Entrez Gene 4267 Human

P14209

**Background:** The protein encoded by this gene is a cell surface glycoprotein involved in leukocyte

migration, T-cell adhesion, ganglioside GM1 and transmembrane protein transport, and T-cell death by a caspase-independent pathway. In addition, the encoded protein may have the ability to rearrange the actin cytoskeleton and may also act as an oncosuppressor in osteosarcoma. This gene is found in the pseudoautosomal region of chromosomes X and Y and escapes X-chromosome inactivation. There is a related pseudogene located immediately

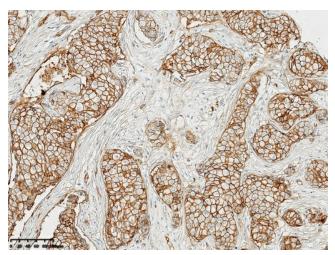

adjacent to this locus. [provided by RefSeq, Mar 2016]

Synonyms: HBA71; MIC2; MIC2X; MIC2Y; MSK5X

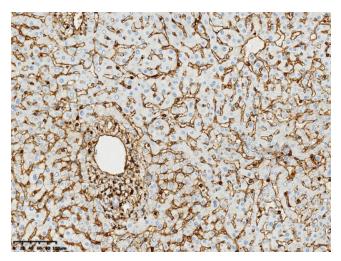

Protein Families: Druggable Genome, Transmembrane

**Protein Pathways:** Cell adhesion molecules (CAMs), Leukocyte transendothelial migration
