Background:	Ubiquitin carboxy-terminal hydrolase L1 (UCHL1) is a deubiquitinating enzyme. Expression of UCHL1 is highly specific to neurons and to cells of the diffuse neuroendocrine system and their tumors. It is abundantly present in all neurons, expressed specifically in neurons and testis/ovary. UCHL1 has been proposed as a candidate biomarker for brain injury. Baseline levels of the biomarker UCHL1 measured in cerebral spinal fluid (CSF) are predictive of long-term multiple sclerosis (MS) progression. Recent studies have demonstrated that UCHL1 could be a potential biomarker for multiple sclerosis, amyotrophic lateral sclerosis, Alzheimer's disease, aggressive multiple myeloma and for discriminating the Parkinson's disease.
