Background:	This gene encodes a member of the RRM family of RNA-binding proteins. The RRM domain is between 80-100 amino acids in length and family members contain one to four copies of the domain. The RRM domain consists of two short stretches of conserved sequence called RNP1 and RNP2, as well as a few highly conserved hydrophobic residues. The protein encoded by this gene has a single, putative RRM domain in its N-terminus. Alternative splicing results in multiple transcript variants encoding different isoforms. HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY RBPMS (Cat# [RC200248], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-RBPMS(Cat# TA800206). Positive lysates [LY423359] (100ug) and [LC423359] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (50ug per lane) from 2 different cell lines and 2 tissue lysates by using anti-RBPMS antibody (TA800206,1:3000; 1mg/ml).
