	RFC2 Mouse Monoclonal Antibody [Clone ID: OTI4C11] – TA800272S		
Background:	The elongation of primed DNA templates by DNA polymerase delta and epsilon requires the action of the accessory proteins, proliferating cell nuclear antigen (PCNA) and replication factor C (RFC). RFC, also called activator 1, is a protein complex consisting of five distinct subunits of 145, 40, 38, 37, and 36.5 kD. This gene encodes the 40 kD subunit, which has been shown to be responsible for binding ATP. Deletion of this gene has been associated with Williams syndrome. Alternatively spliced transcript variants encoding distinct isoforms have been described. [provided by RefSeq]		
Synonyms:	RFC40		
Protein Families	Druggable Genome, Stem cell - Pluripotency		
Protein Pathwa	ys: DNA replication, Mismatch repair, Nucleotide excision repair

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY RFC2 ([RC201138], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-RFC2. Positive lysates [LY419017] (100ug) and [LC419017] (20ug) can be purchased separately from OriGene.
