Background:	This gene is the putative transforming gene of avian sarcoma virus 17. It encodes a protein which is highly similar to the viral protein, and which interacts directly with specific target DNA sequences to regulate gene expression. This gene is intronless and is mapped to 1p32- p31, a chromosomal region involved in both translocations and deletions in human malignancies. [provided by RefSeq]
Synonyms:	AP-1; AP1; c-Jun

## **Product images:**

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY JUN ([RC209804], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-JUN. Positive lysates [LY400825] (100ug) and [LC400825] (20ug) can be purchased separately from OriGene.
