| | Neurofilament (NEFL) Mouse Monoclonal Antibody [Clone ID: OTI3G2] – TA801110S |
|------------------|--|
| Background: | Neurofilaments are type IV intermediate filament heteropolymers composed of light, medium, and heavy chains. Neurofilaments comprise the axoskeleton and they functionally maintain the neuronal caliber. They may also play a role in intracellular transport to axons and dendrites. This gene encodes the light chain neurofilament protein. Mutations in this gene cause Charcot-Marie-Tooth disease types 1F (CMT1F) and 2E (CMT2E), disorders of the peripheral nervous system that are characterized by distinct neuropathies. A pseudogene has been identified on chromosome Y. [provided by RefSeq, Oct 2008] |
| Synonyms: | CMT1F; CMT2E; NF-L; NF68; NFL; PPP1R110 |
| Protein Families | : Druggable Genome, ES Cell Differentiation/IPS |
| Protein Pathway | s: Amyotrophic lateral sclerosis (ALS) |

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY NEFL ([RC205920], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-NEFL. Positive lysates [LY416829] (100ug) and [LC416829] (20ug) can be purchased separately from OriGene.
