Background:	The protein encoded by this gene is a member of the TNF-receptor superfamily. This receptor is expressed by activated, but not by resting, T and B cells. TRAF2 and TRAF5 can interact with this receptor, and mediate the signal transduction that leads to the activation of NF-kappaB. This receptor is a positive regulator of apoptosis, and also has been shown to limit the proliferative potential of autoreactive CD8 effector T cells and protect the body against autoimmunity. Two alternatively spliced transcript variants of this gene encoding distinct isoforms have been reported. [provided by RefSeq, Jul 2008]
Synonyms:	CD30; D1S166E; Ki-1
Protein Families	: Druggable Genome, ES Cell Differentiation/IPS, Stem cell - Pluripotency, Transmembrane
Protein Pathway	s: Cytokine-cytokine receptor interaction

Product images:

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY TNFRSF8 (Cat# [RC219819], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-TNFRSF8(Cat# [TA801630]). Positive lysates [LY420050] (100ug) and [LC420050] (20ug) can be purchased separately from OriGene.

Flow cytometric Analysis of K562 and Ramos cells, using anti-TNFRSF8 antibody ([TA801630]), (Red), compared to a nonspecific negative control antibody (TA50011), (Blue) (1:100).
