#### Serigene PAX5 Mouse Monoclonal Antibody (Biotin conjugated) [Clone ID: OTI3A7] – TA801884AM

Background:This gene encodes a member of the paired box (PAX) family of transcription factors. The<br/>central feature of this gene family is a novel, highly conserved DNA-binding motif, known as<br/>the paired box. PAX proteins are important regulators in early development, and alterations<br/>in the expression of their genes are thought to contribute to neoplastic transformation. This<br/>gene encodes the B-cell lineage specific activator protein that is expressed at early, but not<br/>late stages of B-cell differentiation. Its expression has also been detected in developing CNS<br/>and testis and so the encoded protein may also play a role in neural development and<br/>spermatogenesis. This gene is located at 9p13, which is involved in t(9;14)(p13;q32)<br/>translocations recurring in small lymphocytic lymphomas of the plasmacytoid subtype, and in<br/>derived large-cell lymphomas. This translocation brings the potent E-mu enhancer of the IgH<br/>gene into close proximity of the PAX5 promoter, suggesting that the deregulation of<br/>transcription of this gene contributes to the pathogenesis of these lymphomas. Alternatively<br/>spliced transcript variants encoding different isoforms have been described but their<br/>biological validity has not been determined. [provided by RefSeq, Jul 2008]

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY PAX5 (Cat# [RC222785], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-PAX5(Cat# [TA801884]). Positive lysates [LY413830] (100ug) and [LC413830] (20ug) can be purchased separately from OriGene.
