## **PORIGENE** Topoisomerase II alpha (TOP2A) Mouse Monoclonal Antibody (HRP conjugated) [Clone ID: OTI6B4] – TA802505BM

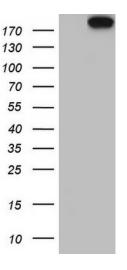

Background:This gene encodes a DNA topoisomerase, an enzyme that controls and alters the topologic<br/>states of DNA during transcription. This nuclear enzyme is involved in processes such as<br/>chromosome condensation, chromatid separation, and the relief of torsional stress that<br/>occurs during DNA transcription and replication. It catalyzes the transient breaking and<br/>rejoining of two strands of duplex DNA which allows the strands to pass through one<br/>another, thus altering the topology of DNA. Two forms of this enzyme exist as likely products<br/>of a gene duplication event. The gene encoding this form, alpha, is localized to chromosome<br/>17 and the beta gene is localized to chromosome 3. The gene encoding this enzyme functions<br/>as the target for several anticancer agents and a variety of mutations in this gene have been<br/>associated with the development of drug resistance. Reduced activity of this enzyme may also<br/>play a role in ataxia-telangiectasia. [provided by RefSeq, Jul

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY TOP2A ([RC221568], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-TOP2A. Positive lysates [LY420704] (100ug) and [LC420704] (20ug) can be purchased separately from OriGene.
