	Progesterone Receptor (PGR) Mouse Monoclonal Antibody [Clone ID: OTI5C12] – TA802714S
Background:	This gene encodes a member of the steroid receptor superfamily. The encoded protein mediates the physiological effects of progesterone, which plays a central role in reproductive events associated with the establishment and maintenance of pregnancy. This gene uses two distinct promotors and translation start sites in the first exon to produce two isoforms, A and B. The two isoforms are identical except for the additional 165 amino acids found in the N- terminus of isoform B and mediate their own response genes and physiologic effects with little overlap. [provided by RefSeq, Jan 2011]
Synonyms:	NR3C3; PR
Protein Families	: Druggable Genome, Nuclear Hormone Receptor, Transcription Factors
Protein Pathway	vs: Oocyte meiosis, Progesterone-mediated oocyte maturation

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY PGR ([RC221303], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-PGR. Positive lysates [LY424456] (100ug) and [LC424456] (20ug) can be purchased separately from OriGene.
