Serigene DAP3 Mouse Monoclonal Antibody [Clone ID: OTI1A12] – TA802787M

Background:Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in
protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes)
consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein
to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed.
Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that
the latter contain a 5S rRNA. Among different species, the proteins comprising the
mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which
prevents easy recognition by sequence homology. This gene encodes a 28S subunit protein
that also participates in apoptotic pathways which are initiated by tumor necrosis factor-
alpha, Fas ligand, and gamma interferon. This protein potentially binds ATP/GTP and might
be a functional partner of the mitoribosomal protein S27. Multiple alternatively spliced
transcript variants encoding distinct isoforms have been found for this gene. Pseudogenes
corresponding to this gene are found on chromosomes 1q and 2q. [provided by RefSeq, Dec

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY DAP3 ([RC223182], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-DAP3. Positive lysates [LY403256] (100ug) and [LC403256] (20ug) can be purchased separately from OriGene.
