Serigene MRPS11 Mouse Monoclonal Antibody [Clone ID: OTI2E9] – TA802861S

Background:Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in
protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes)
consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein
to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed.
Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that
the latter contain a 5S rRNA. Among different species, the proteins comprising the
mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which
prevents easy recognition by sequence homology. This gene encodes a 28S subunit protein
that contains a high level of sequence similarity with ribosomal protein S11P family members.
A pseudogene corresponding to this gene is found on chromosome 20. Sequence analysis
identified two transcript variants that encode different protein isoforms. [provided by RefSeq,

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY MRPS11 (Cat# [RC207075], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MRPS11(Cat# [TA802861]). Positive lysates [LY411534] (100ug) and [LC411534] (20ug) can be purchased separately from OriGene.
