	Melanoma gp100 (PMEL) Mouse Monoclonal Antibody (HRP conjugated) [Clone ID: OTI1E5] – TA803054BM
Background:	This gene encodes a melanocyte-specific type I transmembrane glycoprotein. The encoded protein is enriched in melanosomes, which are the melanin-producing organelles in melanocytes, and plays an essential role in the structural organization of premelanosomes. This protein is involved in generating internal matrix fibers that define the transition from Stage I to Stage II melanosomes. This protein undergoes a complex pattern of prosttranslational processing and modification that is essential to the proper functioning of the protein. A secreted form of this protein that is released by proteolytic ectodomain shedding may be used as a melanoma-specific serum marker. Alternate splicing results in multiple transcript variants. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY SILV ([RC200663], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-SILV. Positive lysates [LY402062] (100ug) and [LC402062] (20ug) can be purchased separately from OriGene.

Immunohistochemical staining of paraffinembedded Human Kidney tissue within the normal limits using anti-SILV mouse monoclonal antibody. ([TA803054]) Dilution: 1:150
