CD63 Mouse Monoclonal Antibody [Clone ID: OTI3D9] – TA803393S

Background: The protein encoded by this gene is a member of the transmembrane 4 superfamily, also known as the tetraspanin family. Most of these members are cell-surface proteins that are characterized by the presence of four hydrophobic domains. The proteins mediate signal transduction events that play a role in the regulation of cell development, activation, growth and motility. The encoded protein is a cell surface glycoprotein that is known to complex with integrins. It may function as a blood platelet activation marker. Deficiency of this protein is associated with Hermansky-Pudlak syndrome. Also this gene has been associated with tumor progression. Alternative splicing results in multiple transcript variants encoding different protein isoforms. [provided by RefSeq, Apr 2012]

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CD63 ([RC201733], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CD63. Positive lysates [LY419757] (100ug) and [LC419757] (20ug) can be purchased separately from OriGene.

HEK293T cells transfected with either [RC201733] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-CD63 antibody ([TA803393]), and then analyzed by flow cytometry (1:100).

Flow cytometric Analysis of MCF-7 cells, using anti-CD63 antibody ([TA803393]), (Red), compared to isotype control, (green), and negative control (PBS), (Blue) (1:100)
