Background: This gene encodes a component of the oligosaccharyltransferase complex which catalyzes

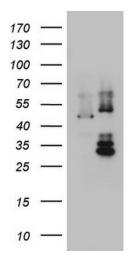

the transfer of high-mannose oligosaccharides to asparagine residues on nascent polypeptides in the lumen of the rough endoplasmic reticulum. The protein complex copurifies with ribosomes. The product of this gene is also implicated in the processing of advanced glycation endproducts (AGEs), which form from non-enzymatic reactions between sugars and proteins or lipids and are associated with aging and hyperglycemia. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY DDOST ([RC200672], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-DDOST. Positive lysates [LY417440] (100ug) and [LC417440] (20ug) can be purchased separately from OriGene.

Western blot analysis of A549 cell lysate (35ug) by using anti-DDOST monoclonal antibody. Dilution: 1:500
