| Background:           | This gene encodes fibronectin, a glycoprotein present in a soluble dimeric form in plasma,<br>and in a dimeric or multimeric form at the cell surface and in extracellular matrix. Fibronectin<br>is involved in cell adhesion and migration processes including embryogenesis, wound healing,<br>blood coagulation, host defense, and metastasis. The gene has three regions subject to<br>alternative splicing, with the potential to produce 20 different transcript variants. However,<br>the full-length nature of some variants has not been determined. [provided by RefSeq, Jul<br>2008] |

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY FN1 (Cat# [RC212860], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-FN1(Cat# [TA803784]). Positive lysates [LY409278] (100ug) and [LC409278] (20ug) can be purchased separately from OriGene.
