Serigene hHR23b (RAD23B) Mouse Monoclonal Antibody [Clone ID: OTI9F8] – TA804863M

Background:The protein encoded by this gene is one of two human homologs of Saccharomyces
cerevisiae Rad23, a protein involved in the nucleotide excision repair (NER). This protein was
found to be a component of the protein complex that specifically complements the NER
defect of xeroderma pigmentosum group C (XP-c) cell extracts in vitro. This protein was also
shown to interact with, and elevate the nucleotide excision activity of 3-methyladenine-DNA
glycosylase (MPG), which suggested a role in DNA damage recognition in base excision repair.
This protein contains an N-terminal ubiquitin-like domain, which was reported to interact
with 26S proteasome, and thus this protein may be involved in the ubiquitin mediated
proteolytic pathway in cells. Alternative splicing results in multiple transcript variants
encoding distinct isoforms. [provided by RefSeq, Sep 2011]

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY RAD23B ([RC202185], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-RAD23B. Positive lysates [LY401012] (100ug) and [LC401012] (20ug) can be purchased separately from OriGene.
