The protein encoded by this gene is one of two human homologs of Saccharomyces cerevisiae Rad23, a protein involved in the nucleotide excision repair (NER). This protein was found to be a component of the protein complex that specifically complements the NER defect of xeroderma pigmentosum group C (XP-c) cell extracts in vitro. This protein was also shown to interact with, and elevate the nucleotide excision activity of 3-methyladenine-DNA glycosylase (MPG), which suggested a role in DNA damage recognition in base excision repair. This protein contains an N-terminal ubiquitin-like domain, which was reported to interact with 26 S proteasome, and thus this protein may be involved in the ubiquitin mediated proteolytic pathway in cells. Alternative splicing results in multiple transcript variants encoding distinct isoforms. [provided by RefSeq, Sep 2011]

HEK293T cells were transfected with the pCMV6ENTRY control (Left lane) or pCMV6-ENTRY RAD23B ([RC202185], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-RAD23B. Positive lysates [LY401012] (100ug) and [LC401012] (20ug) can be purchased separately from OriGene.

Equivalent amounts of cell lysates (10 ug per Iane) of wild-type Hela cells (WT, Cat\# LC810HELA) and RAD23B-Knockout Hela cells (KO, Cat\# [LC810196]) were separated by SDS-PAGE and immunoblotted with anti-RAD23B monoclonal antibody [TA804868]. Then the blotted membrane was stripped and reprobed with antiHSP90AB1 antibody ([TA500494]) as a loading control (1:500).
