Background: Neurofilaments are type IV intermediate filament heteropolymers composed of light,

medium, and heavy chains. Neurofilaments comprise the axoskeleton and functionally maintain neuronal caliber. They may also play a role in intracellular transport to axons and dendrites. This gene encodes the medium neurofilament protein. This protein is commonly used as a biomarker of neuronal damage. Alternative splicing results in multiple transcript

variants encoding distinct isoforms. [provided by RefSeq, Oct 2008]

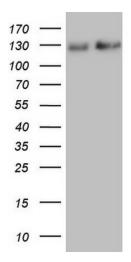

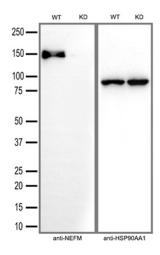

Synonyms: NEF3; NF-M; NFM

Protein Pathways: Amyotrophic lateral sclerosis (ALS)

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY NEFM ([RC224475], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-NEFM. Positive lysates [LY417338] (100ug) and [LC417338] (20ug) can be purchased separately from OriGene.

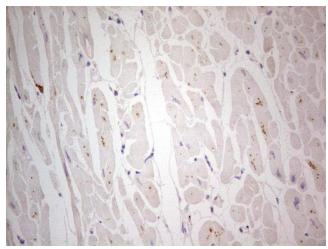

Equivalent amounts of cell lysates (30 ug per lane) of wild-type HeLa cells(WT) and NEFM-Knockdown HeLa cells(KD) were separated by SDS-PAGE and immunoblotted with anti-NEFM monoclonal antibody [TA805823](1:5000).Then the blotted membrane was stripped and reprobed with anti-HSP90AA1 antibody as a loading control.
