| Background:             | This gene encodes a member of the TNF-receptor superfamily. The encoded receptor has<br>been shown to have increased expression upon T-cell activation, and it is thought to play a<br>key role in dominant immunological self-tolerance maintained by CD25(+)CD4(+) regulatory T<br>cells. Knockout studies in mice also suggest the role of this receptor is in the regulation of<br>CD3-driven T-cell activation and programmed cell death. Three alternatively spliced transcript<br>variants of this gene encoding distinct isoforms have been reported. [provided by RefSeq, Feb |

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY TNFRSF18 ([RC219997], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-TNFRSF18. Positive lysates [LY418153] (100ug) and [LC418153] (20ug) can be purchased separately from OriGene.
