## Serigene Lipin 1 (LPIN1) Mouse Monoclonal Antibody [Clone ID: OTI4C11] – TA806417

Background:This gene encodes a magnesium-ion-dependent phosphatidic acid phosphohydrolase<br/>enzyme that catalyzes the penultimate step in triglyceride synthesis including the<br/>dephosphorylation of phosphatidic acid to yield diacylglycerol. Expression of this gene is<br/>required for adipocyte differentiation and it also functions as a nuclear transcriptional<br/>coactivator with some peroxisome proliferator-activated receptors to modulate expression of<br/>other genes involved in lipid metabolism. Mutations in this gene are associated with<br/>metabolic syndrome, type 2 diabetes, and autosomal recessive acute recurrent<br/>myoglobinuria (ARARM). This gene is also a candidate for several human lipodystrophy<br/>syndromes. Alternative splicing results in multiple transcript variants encoding distinct<br/>isoforms. Additional splice variants have been described but their full-length structures have<br/>not been determined. [provided by RefSeq, May 2012]
