SANTES (CCL5) Mouse Monoclonal Antibody [Clone ID: OTI10G5] – TA806662M

Background:	This gene is one of several chemokine genes clustered on the q-arm of chromosome 17.
	Chemokines form a superfamily of secreted proteins involved in immunoregulatory and
	inflammatory processes. The superfamily is divided into four subfamilies based on the
	arrangement of the N-terminal cysteine residues of the mature peptide. This chemokine, a
	member of the CC subfamily, functions as a chemoattractant for blood monocytes, memory T
	helper cells and eosinophils. It causes the release of histamine from basophils and activates
	eosinophils. This cytokine is one of the major HIV-suppressive factors produced by CD8+ cells.
	It functions as one of the natural ligands for the chemokine receptor chemokine (C-C motif)
	receptor 5 (CCR5), and it suppresses in vitro replication of the R5 strains of HIV-1, which use
	CCR5 as a coreceptor. Alternative splicing results in multiple transcript variants that encode
	different isoforms. [provided by RefSeq, Jul

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CCL5 ([RC203799], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CCL5. Positive lysates [LY401044] (100ug) and [LC401044] (20ug) can be purchased separately from OriGene.
