| Background:             | The Fos gene family consists of 4 members: FOS, FOSB, FOSL1, and FOSL2. These genes<br>encode leucine zipper proteins that can dimerize with proteins of the JUN family, thereby<br>forming the transcription factor complex AP-1. As such, the FOS proteins have been<br>implicated as regulators of cell proliferation, differentiation, and transformation. In some<br>cases, expression of the FOS gene has also been associated with apoptotic cell death.<br>[provided by RefSeq, Jul 2008] |

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY FOS (Cat# [RC202597], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-FOS (Cat# [TA806977])(1:4000).

Western blot analysis of extracts (10ug) from 4 different cell lines by using anti-FOS monoclonal antibody (1:200).
